Cactus fragilis Nutt.: Gen. N. Amer. Pl.
[Nuttall]. 1: 296. 1818

BY THOMAS NUTTALL, F. L. S.
FELLOW OF THE AMERICAN PHILOSOPHICAL SOCIETY,
AND OF THE ACADEMY OF NATURAL SCIENCES
OF PHILADELPHIA, &c.

5. * *fragilis*. Articulately proliferous; articulations short and oblong, somewhat terete, doubly spiny and fragile; flowers solitary, small, at the point of the articulations; fruit dry and spiny. HAB. From the Mandans to the mountains, in sterile, but moist situations, much smaller than the preceding, and remarkable for its brittleness, the articulations though not very tumid coming off and attaching themselves to every thing which they happen to touch, so much so as to lead the hunters to say that it grows without roots.—Most of the species of this section have irritable or sensitive stamina.
