Chromosome numbers in some cacti of western North America. IV.¹

Donald J. Pinkava and Bruce D. Parfitt²

Department of Botany and Microbiology, Arizona State University, Tempe, Arizona 85287

PINKAVA, D. J., and B. D. PARFITT (Dept. Bot. and Microbiol., Arizona State Univ., Tempe, 85287). Chromosome numbers in some cacti of western North America. IV. Bull. Torrey Bot. Club 109: 121-128. 1982.—Documented meiotic and mitotic chromosome numbers are reported for 51 taxa in 41 species of 10 genera of Cactaceae of southwestern United States and northern Mexico. Included are first counts for 21 taxa belonging to 18 species plus one interspecific triploid hybrid (*Opuntia kleiniae* × *O. leptocaulis*); and new counts for 4 previously reported species.

Key words: Cactaceae; chromosome numbers; United States; Mexico.

This is the fourth in a series of studies done in an attempt to understand the evolutionary and taxonomic problems in the Cactaceae. Diploid and polyploid taxa were observed, all consistent with the base number, $x = 11$. Thus far in this series polyploidy occurs in 26 of 45 taxa (57.8%) of the Opuntioideae (including 4 taxa represented by both diploid and polyploid individuals) and in 8 of 50 taxa (16.0%) of the Cactoideae.

Materials and methods. Flower buds were collected in developmental series from plants growing in native habitats or in cultivation. Buds were killed and fixed in chloroform, ethanol and glacial acetic acid (6:3:1 v/v), transferred to 70% ethanol and refrigerated. Anthers were squashed in acetocarmine and mounted in Hoyer's medium (Beeks 1955). The mitotic count (*O. martiana*) was obtained from root tips, fixed, stained and mounted according to Parfitt (1979). Voucher specimens are deposited in

ASU. Nomenclature largely follows that of Benson (1969a, b, c), Britton and Rose (1919-1923), and Bravo-Hollis (1978).

Results and discussion. Chromosome counts (Table 1) were made from 73 individuals belonging to 50 taxa in 41 species of 10 genera. Counts for 22 taxa are first published reports. Newly counted in our series are 35 taxa (Figs. 1-35), including one interspecific hybrid discussed below and two counts different from those we had reported for the species *O. bigelovii* (Pinkava and McLeod 1971) and *O. whipplei* (Pinkava et al. 1973). Of this group, the following eleven previously published counts are in agreement with our findings: *Opuntia cholla* (Yuasa et al. 1973), *O. imbricata* var. *imbricata* (Bowden 1945; Conde 1975; Katagiri 1953; Weedin & Powell 1978; Yuasa et al. 1973), *O. kleiniae* var. *kleiniae* (Fischer in Benson 1969b; Weedin & Powell 1978; Yuasa et al. 1973), *O. lindheimeri* var. *linguiformis* (Weedin & Powell 1978; Yuasa et al. 1973); *O. streptacantha* (Yuasa et al. 1973), *O. violacea* var. *castetteri* (Weedin & Powell 1978), *Echinocereus pectinatus* var. *pectinatus* (Ross 1981), *E. triglochidiatus* var. *neomexicanus* (Weedin & Powell 1978), *Mammillaria brandegeei* (Remski 1954), *M. gummifera* vars. *applicata* (Beard 1937; Remski 1954; Stockwell 1935; Weedin & Powell 1978), and *meiacantha* (Weedin & Powell 1978). Individuals of *Opuntia streptacantha* are also reported as diploids (Yuasa et al. 1973). Counts at variance with our findings are: $2n = 44$ for

¹Field work supported in part by National Science Foundation grants BMS 7501417 to Dr. Thomas H. Nash III and DEB 77-00182 to Donald J. Pinkava and Timothy Reeves, Dept. of Botany and Microbiology, Arizona State University.

²Appreciation is expressed to R. K. Brown, R. C. Brown, Tom Hensel, D. J. Keil, Elinor Lehto, M. G. McLeod, L. A. McGill and T. H. Nash for aid in field collections of specimens and buds. We thank Lyman Benson and Charles Glass for aid in the identification of certain specimens but final determinations are our own.

Received for publication July 1, 1981.

Table I. Chromosome counts of certain cacti of western North America

OPUNTIOIDEAE

- Opuntia acanthocarpa* Engelmann & Bigelow var. *major* (Engelmann & Bigelow) L. Benson
 $n = 11$ ARIZONA: Pinal Co.: ca. 2 mi SW of Boyce Thompson Southwestern Arboretum, *Pinkava* 13820, *Pinkava* & McGill.
- Opuntia aurea* Baxter
 $n = 33$ ARIZONA: Mohave Co.: 4.1 mi NNE of Cane Beds via Rosy Canyon, *Parfitt* 2870, 2971.
UTAH: Washington Co.: 11.2 mi N of Kanab, *Parfitt* 2863, 2864, 2865.
- * *Opuntia basilaris* Engelmann & Bigelow var. *woodburyi* Earle
 $n = 44$ UTAH: Washington Co.: Warner Valley, 2.7 mi W of Fort Pierce, *Parfitt* 2868 (Fig. 1).
- ! *Opuntia bigelovii* Engelmann var. *bigelovii*
 $3n = 11_{\text{III}}$ CALIFORNIA: San Diego Co.: Hwy S-2, 25.9 mi SSE of jctn Hwy 78, *Parfitt* 2777, *Pinkava*, Keil & McLeod (Fig. 2).
- Opuntia chlorotica* Engelmann & Bigelow
 $n = 11$ ARIZONA: Mohave Co.: 1 mi NW of Peacock Rd. on old Hwy 93, *Parfitt* 2546.
- Opuntia cholla* Weber
 $n = 11$ MEXICO: Baja California Norte: 5.5 mi E, then 4.5 mi NE of Rosario, *Pinkava* 8791 & McGill (Fig. 3); 4.8 mi E of Rosario, *Pinkava* 11159, McGill, Hensel & MacIntyre (counted by T. Hensel); 3.9 mi SE of Progresso, then 2.4 mi S toward Santa Catarina, *Pinkava* 9117, Nash & McGill.
- Opuntia curvospina* Griffiths
 $n = 22$ ARIZONA: Mohave Co.: old Hwy 93, 0.4 mi SE of Peacock Mt. Rd., Butterwick 5003, *Parfitt* & Hillyard; west bajada of Cerbat Mts., *Parfitt* 2541 & G. Brown.
- Opuntia echinocarpa* Engelmann & Bigelow var. *echinocarpa*
 $n = 11$ CALIFORNIA: San Diego Co.: S of Clark Dry Lake, Hwy S-22, *Parfitt* 2756, *Pinkava*, Keil & McLeod (gold-spined form); Hwy 78, E of Anza-Borrego State Park, *Parfitt* 2741C, *Pinkava*, Keil & McLeod.
- * *Opuntia erinacea* Engelmann & Bigelow var. *utahensis* (Engelmann) L. Benson
 $n = 44$ ARIZONA: Coconino Co.: House Rock Valley, N. of Rock Canyon, *Parfitt* 2859, 2862.
ARIZONA: Mohave Co.: 6.7 mi S of Hwy 889 on Mt. Trumbull Rd., G. Brown 660 & *Parfitt*; 4.2 mi SW of Wolf Hole along BLM 64, G. Brown 851 & *Parfitt*; 0.65 mi NW of Bulrush Canyon, road to Pipe Springs, *Parfitt* 2873, 2874, 2876 (Fig. 4).

O. moelleri; and $3n = 33$ for *O. prolifera* (Yuasa *et al.* 1973).

As with the triploid specimen of *Opuntia basilaris* var. *treleasei* reported earlier (Pinkava *et al.* 1977), the triploid *O. bigelovii* var. *bigelovii* specimen (Parfitt *et al.* 1977) does not differ significantly from its diploid counterpart except in size, suggesting autotriploidy, believed to be formed from the union of reduced (n) and unreduced ($2n$) gametes. Remski (1954) observed tetraploid and diploid cells in root tips of two *Mammillaria* spp. and postulated that autoploids might arise by mitotic abnormalities producing a polyploid shoot. Ross (1981) found a tetraploid microsporangiate among diploid ones in *Pereskia diazromeroana*. Either mechanism could account for $2n$ gametes in basically diploid populations. Putative auto- and alloautotriploids involving *Opuntia fulgida* and *O. spinosior* are currently being investigated (Pinkava & McGill 1979).

A natural hybrid (Pinkava *et al.* 13530A) found in San Luis Potosi, presumably *O. kleiniae* var. *kleiniae* \times *O. leptocaulis*, shows intermediate morphology approaching, slightly, the larger flowers, fruits and stem diameter of *O. kleiniae* and the partly red and proliferating fruits of *O. leptocaulis*. Thus far both putative parents are known only as tetraploids in the Chihuahuan Desert (Fischer 1962; Pinkava *et al.* 1973) but diploid forms of each are known from the Sonoran Desert and further work may uncover diploid specimens of either or both putative parents in the Chihuahuan Desert. Fischer (1962) reports a similar cultivated hybrid of this presumed parentage, (presumably originating from near the Davis Mountains, Texas), as $3n = 33$. He also counted three triploid individuals (*Fischer Texas A, C, G*) and two tetraploid individuals (*Fischer Texas E, F*) of *O. kleiniae* var. *kleiniae* from a population 8 miles south of Kent, Texas, at 4600 feet elevation, but admits that "it seems likely the other plants of *O. kleiniae* which have a chromosome number of 33 are also hybrids of the same parentage as the hybrid discussed above." Anthony (1956) describes in detail an uncounted hybrid between these same putative parents from a population at

Musquiz Creek, Jeff Davis County, Texas. She reports that in "most respects, these hybrid plants resemble *O. kleiniae* more closely than *O. leptocaulis*", suggesting to us that the *O. kleiniae* parent may have contributed the $2n$ gamete.

Opuntia martiniana was recently studied by Parfitt (1980) who has shown it to have a unique style shape (tapering downward) and a tetraploid chromosome number which distinguishes it from *O. littoralis* (Engelm.) Cockerell, warranting a change in its status to the species level. Although partly sympatric with the tetraploid *O. curvospina*, *O. martiniana* may be separated from it by style shape, other morphological characters and meiotic behavior (Parfitt 1980). *Opuntia martiniana* shows laggards (Fig. 11) but lacks other aberrations such as an inversion bridge with fragment (Pinkava *et al.* 1973, Fig. 4) and quadrivalent formation found in *O. curvospina*.

Reported in the four-parted series thus far are chromosome counts for 255 specimens of cacti belonging to 113 taxa in 78 species (plus one interspecific and one intergeneric hybrids) of which 91 were new counts when reported, 7 differing from previously published accounts.
